> What should I do if I test positive for COVID-19?

MONOCLONAL ANTIBODY THERAPY
TO TREAT COVID-19

Monoclonal antibody therapy acts as a shortcut to boost your immune system with antibodies to help fight COVID-19.

HOW DO ANTIBODIES HELP TREAT COVID-19?

- Antibodies are part of the body's immune system defending against viruses and bacteria.
- Developed in the lab, not the body, monoclonal antibodies are very good at fighting the coronavirus.
- When you receive monoclonal antibodies, your body gets the extra boost it needs to steer clear of more severe COVID-19 symptoms.

ARE YOU AT A HIGH RISK OF SEVERE COVID-19 SYMPTOMS?

- **65 YEARS** or older
- **55 YEARS** or older with: heart disease, high blood pressure, or a chronic respiratory disease such as asthma or COPD
- **12 YEARS** or older with: obesity, diabetes, chronic kidney disease, or weakened immune system

WHAT HAPPENS DURING TREATMENT?

- Receive a one-time outpatient IV infusion
- Get temporary, improved immunity to fight COVID-19
- Stay home, away from others, for 10 days

If you've tested positive for COVID-19 in the past **10 days** and you are in a high-risk group, ask your healthcare provider if monoclonal antibodies could put you.....

....on the road to recovery!

Have a plan to act fast if you **test positive for COVID-19.**
